Table 5.1: List of some mathematical terms discussed in this chapter

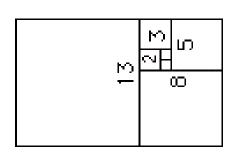

### Ad Hoc Mathematics problems

- The simpler ones
- Brute force (mathematical simulation)
- Finding Pattern or Formula
- Grid
- Number Systems or Sequences

#### **Combinatorics**

- Fibonacci Numbers
- Binomial Coefficients
- Catalan Numbers

#### Fibonacci numbers

$$fib(0) = 0$$
,  $fib(1) = 1$ ,  
and for  $n \ge 2$ ,  $fib(n) = fib(n-1) + fib(n-2)$ 

- Thus the sequence begins as follows:
- 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144....

## Fibo implementation

- DP technique : O(n)
- Compute the *n*-th *F*ibo using matrix power :
   O(log n)
- Compute the *n*-th *F*ibo using approximation technique : O(1)

# Fibo with approximation technique

Using Binet's formula

$$Fib(n) = \frac{\Phi^{n} - ((-\Phi)^{-n})}{\sqrt{5}}$$

$$Fib(n) = \frac{\Phi^{n} - ((-\phi)^{n})}{\sqrt{5}}$$

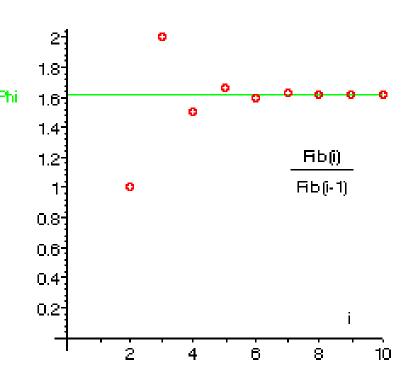

$$Fib(n) = \frac{\Phi^n - \frac{-1^n}{\Phi^n}}{\sqrt{5}}$$

# Fibo with approximation technique

- Φ (Phi): the limit of the ratio of a fib(i) and its predecessor, fib(i-1).
- Mathematically,  $\Phi$  is equal to:

$$1+\sqrt{5}/2$$

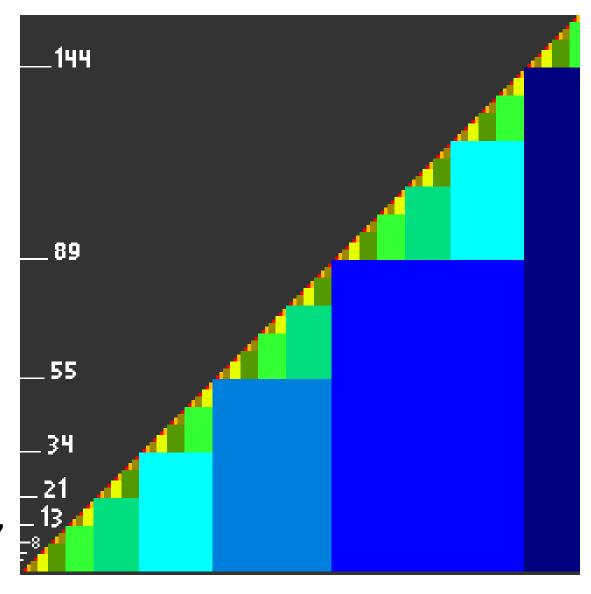

or approximately 1.618034.

#### Zeckendorf's theorem

The sum of one or more distinct fibo numbers in such a way that the sum does not include any 2 consecutive Fibonacci numbers.

Fibo seq: 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144....

https://en.wikipedia.org/wiki/Zeckendorf%27s\_theorem

#### Zeckendorf's theorem

- For example, the Zeckendorf of 100 is
   100 = 89 + 8 + 3.
- The other ways of representing 100 as the sum of Fibonacci numbers (NOT Zeckendorf) – for example

$$100 = 89 + 8 + 2 + 1$$
  
 $100 = 55 + 34 + 8 + 3$ 

#### Pisano Period

The smallest r > 0 such that  $F_0 \equiv F_r \pmod{m}$  and  $F_1 \equiv F_{r+1} \pmod{m}$ , where  $F_k$  is the  $k^{th}$  Fibonacci number, is the Pisano period of m. We denote this period with  $\pi(m)$ 

n	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
$F_n$	0	1	1	2	3	5	8	13	21	34	55	89	144	233	377	610
$F_n \pmod{2}$	0	1	1	0	1	1	0	1	1	0	1	1	0	1	1	0
$F_n \pmod{3}$	0	1	1	<b>2</b>	0	<b>2</b>	<b>2</b>	1	0	1	1	2	0	2	2	1
$F_n \pmod{4}$	0	1	1	<b>2</b>	3	1	0	1	1	2	3	1	0	1	1	2

$$\pi(2) = 3$$
,  $\pi(3)=8$ ,  $\pi(4)=6$ 

#### Pisano Period

The last 1/ last 2/ last 3 / last 4 digits of Fibonacci numbers repeats with a period of 60 / 300 / 1500/ 15000

n	- Fn	En mod 60	- En mod 300	En mod 1500	Fn mod 15000
n	0	_	11111100 300	11111100 1300	11111100 13000

21	10946	26	146	446	
22	17711	11	11	1211	2711
23	28657	37	157	157	

#### 5.4.2 Combination

The number of r-combinations of a set with n elements, where n is a nonnegative integer and r is an integer with  $0 \le r \le n$ , equals C(n, r) = n!

$$C(n, r) = n!$$

$$r! (n - r)!$$

#### THE BINOMIAL THEOREM

 Let x and y be variables, and let n be a nonnegative integer.
 Then

$$(x+y)^n = \sum_{j=0}^n \binom{n}{j} x^{n-j} y^j = \binom{n}{0} x^n + \binom{n}{1} x^{n-1} y + \dots + \binom{n}{n-1} x y^{n-1} + \binom{n}{n} y^n$$

# Pascal's Triangle

#### Binomial coefficient

- Using top-down dynamic programming
- Using 2D memo table

```
C(n,0) = C(n,n) = 1 // \text{ base cases.}

C(n,k) = C(n-1,k-1) + C(n-1,k) // \text{ take or ignore an item, } n > k > 0.
```

#### 5.4.3 Catalan numbers

- the problem of completely equivalent
- involving recursively-defined objects
- Using bottom-up DP

$$C_n = \frac{1}{n+1} {2n \choose n} = \frac{(2n)!}{(n+1)! \, n!} = \prod_{k=2}^n \frac{n+k}{k}$$
 for  $n \ge 0$ .

## **Mountain Ranges**

How many "mountain ranges" can you form with n upstrokes and n downstrokes that all stay above the original line?

n = 0:	*	1 way
n = 1:	/\	1 way
n=2:	/\	2 ways
	/\/ / \	
n = 3:	$\wedge$	5 ways
	/\ /\ /\\ /\\	
	/\/ /\/  / \/ /  /	

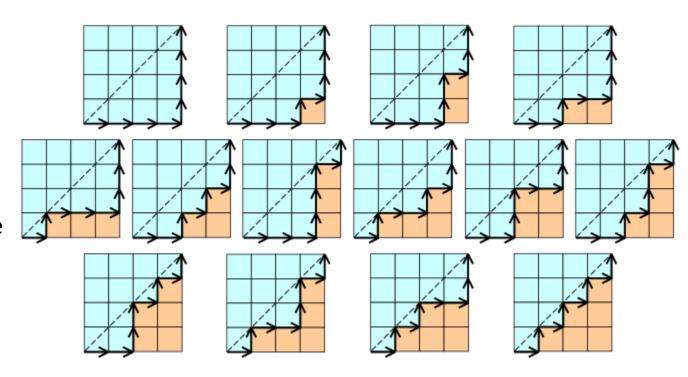

# **Polygon Triangulation**

count the number of ways to triangulate a regular polygon with n + 2 sides

### Monotonic paths

counts the number of monotonic paths along the edges of an *n×n* grid, Which do not pass above the diagonal. A monotonic path is one which starts in the lower left corner, finishes in the upper right corner, and consists entirely of edges pointing rightwards or upwards.
